

- Other architecture notes
 - Skimming new contents and assign them tags using a word association script
 - Can add a display for the user in a linked bubble map to show them a fun way to look at new recommendations
- Standard Content Recommendation Model
 - A lot of information on implementation
 - Might reward isolation in topics since users are more likely to stay there
 - A lot of available libraries making it easier to start
- Node Map model
 - Create a new node per topic
 - Have the nodes contain tags or possibly direct connections to other topics
 - Assign a weight for every connection to create a better representation
 - Have a model that is rewarded when the user learns and continues to learn into new categories instead of rewarding just time spent on category
 - New topics will added quickly and efficiently based on wikipedia articles
 - Issues are that it is experimental might not work
